HTML, CSS & JAVASCRIPT

Every website is built from just three languages. Think of a house.

HTML
The structure: walls, rooms, doors.
Headings, paragraphs, images, buttons.

CSS
Colours and furniture: fonts, spacing, layout, how it looks on phone vs laptop.

JavaScript
The electricity: menus opening, likes counting, forms checking your input.

ALL THREE IN ONE TINY PAGE

```
<button id="b">Like 0</button>          <!— HTML —>

<style>
  #b { background: #FF4D1F; color: white; }   /* CSS */
</style>

<script>                                      // JavaScript
  let n = 0;
  b.onclick = () => b.textContent = "Like " + (++n);
</script>
```

QUICK MAP

Language	Job	Without it
HTML	Structure & content	No page at all
CSS	Style & layout	Plain, ugly page
JavaScript	Behaviour	Static page, nothing reacts

TRY IT YOURSELF

- Right-click any site → **View Page Source** (or Ctrl+U). That's the real HTML.
- Save the code above as `index.html` and open it in your browser.
- Change the colour in CSS and refresh. You just edited a website.
