FRONTEND, BACKEND & DATABASE

Every website has three parts. Think of a restaurant.

Part	Restaurant	Does what	Examples
Frontend	Dining area	What you see: pages, buttons, design	HTML, CSS, JS, React
Backend	Kitchen	Logic: take order, check payment, decide	Node.js, Python, Java
Database	Store room	Keeps all data safe: users, orders, passwords	PostgreSQL, MongoDB

ONE TAP ON INSTAGRAM

1. **Frontend** shows the like button and sends your tap.
2. **Backend** receives it and decides what to do (is this user logged in?).
3. **Database** saves that you liked the post, so it's still there tomorrow.

HOW THEY TALK

```
Frontend ──(API request)──► Backend ──(query)──► Database
Frontend ◄──(API response)── Backend ◄──(data)─── Database
```

FULL STACK MEANS

You can work on all three parts.

TRY IT YOURSELF

- Open any site, press F12 → Network. Each request is the frontend asking a backend.
- Ask: what data is this page showing? That data lives in a database.
