SQL VS NOSQL

Two kinds of database. Neither is better. Choose by the job.

SQL
Tables with rows and columns, fixed structure. MySQL, PostgreSQL.

NoSQL
No fixed tables. Data lives in flexible documents (JSON-like). MongoDB.

SAME DATA, TWO SHAPES

```
-- SQL table: students
id | name  | class
1  | Rahul | TY
2  | Sneha | SY
```

```
// NoSQL document
{ "name": "Rahul",
  "class": "TY",
  "skills": ["JS","React"] }
```

SAME QUESTION, TWO QUERIES

```
SQL:    SELECT name FROM students WHERE class = 'TY';
NoSQL:  db.students.find({ class: "TY" })
```

WHEN TO CHOOSE

Pick SQL when	Pick NoSQL when
Data is clean and connected (bank accounts, students, orders)	Data keeps changing shape (chats, posts, logs)
You need strong consistency and relationships	You need flexibility and fast iteration
