SIGN IN WITH GOOGLE

How you log in without giving the website your password.

Think of a **hotel key card**. The hotel desk (Google) checks who you are and hands the website a temporary card. The website never sees your password.

THE FLOW

1. You tap **Sign in with Google** on a website.
2. The website sends you to **Google**. You log in there.
3. Google asks: *allow this site to know your name and email?* You say yes.
4. Google sends the website a one-time **code**.
5. The website exchanges that code for a **token**: a temporary key card that says "this person is genuine".
6. The website lets you in. Your password never left Google.

KEY WORDS

Word	Meaning
OAuth	Open Authorization: a standard to let one app access limited info on your behalf, without your password
Token	A temporary key card, with limited permissions and an expiry
OpenID Connect	The layer on OAuth that tells the site who you are (used by Sign in with Google)

STAY SAFE

- Only sign in on sites you trust, and check the permissions Google shows.
- Review and remove old connected apps in your Google account's security settings.
- If you build this: never put your client secret in frontend code or in a public repo.
